Project Case Chosen:

Accenture Project Case: AI-Powered Study Companion for Filipino Learners

What we will develop:

We're developing TAKO (Teaching with Adaptive Knowledge Orchestration). It is a native Android, offline-first, AI-powered educational RPG where Filipino students battle math questions instead of the typical monsters. They get personalized misconception explanations instead of generic “*wrong answer*” feedback, and can play with zero connection.

What we have developed:

The sprites for the game and the question templates.
